How to Build a Custom N-tier Application Infrastructure with Private Cloud

January 4, 2013 | **Private Cloud**

g+1   Like   0

IT application infrastructures are not known for their flexibility. It takes a long time to design, build and maintain these infrastructures, much too long for an IT department looking to quickly change with the times. A business without a competitive edge can quickly fall behind.

A private cloud platform is a permanent, flexible solution to this issue. A private cloud like savvisdirect's [AppGrid](#)^{SM} can save you from the headache that usually comes with trying to develop application infrastructures. With a traditional approach, you could be working on your application infrastructure and the associated integrations for months.

AppGrid on the other hand allows you to visually assemble, configure and troubleshoot your environment within a few hours of starting your project. It acts as a visual editor, and you also have access to a large catalog of virtual appliances, ensuring that you always have access to what you need. Our private cloud also features pre-assembled environments that you can use and reuse in different applications.

A private cloud lets you do more than simply create and maintain; you can also debug any of your applications using a similar set of visual development tools. You can also keep track of any changes made to the application using a version-control system like Subversion or CVS. View any and all changes made up to this point. You can even restore the application to a previous version and roll back unwanted changes. Snapshots are a piece of cake.

Just like public cloud platforms, a dedicated private cloud still offers all of the scalability that you expect from the cloud. It leverages a single-tenant environment housing your access credentials, applications, and data securely behind a multi-tier firewall security layer you control. savvisdirect provides additional network security protection with anti-DDoS and Intrusion Detection Services at the public IP layer. If you need more storage, RAM or CPU, you simply ask your cloud vendor to increase it.

Contact a savvisdirect Cloud Specialist today at 1-855-459-5121 to learn more about AppGrid.
